1. System View

Provides a workflow-level overview to help understand the system behavior and identify high-level patterns and issues in the agent execution.

Recurring Issues Across Workflow
Most common issues identified in full trace evaluations

ISSUE	COUNT	SEVERITY	FREQUENCY
Redundant or duplicate operations (API calls, planning cycles, cart management) that could be consolidated	123	0.23	34.1%
Incomplete workflows that terminate before completing all sub-tasks	90	0.40	24.9%
Inefficient API usage, such as fetching all data then filtering locally, not using bulk/batch operations, or making multiple similar calls	83	0.20	23.0%

User Intent: Buy me the top-rated gaming console controller that's available now on amazon for each of my siblings, and have it delivered to their homes with gift wrapping. I want to give them identical gifts.

Detailed Feedback

The trajectory shows strong initial understanding of the task, correctly identifying required applications and decomposing the problem. Reasoning steps are well-documented, and most API interactions are appropriate. However, the workflow fails to handle inventory constraints, leading to repeated cart-addition errors and a mis-filtered product selection. State management is inconsistent, causing contradictory progress reports and an incomplete final deliverable. Future iterations should incorporate early inventory checks, maintain a single-order-per-recipient flow, and ensure that only products matching the "gaming console controller" type are considered.
